1) LookBack Bars (0=Disabled) = 5000

The first input is called **Lookback**, with a default setting of **5000** bars. **Easy Breakout** uses a statistics dashboard, and this input controls how many past signals are displayed based on the number of bars you select. A higher number means the indicator will look further back to display more signals. Since the indicator is very light, you can easily increase this number without any issue.

General Settings

2) Max Breakout Length (Bars) = 200

It's the maximum length of previous bars to search for breakouts

3) Support and Resistance Width (%) = 3%

This input defines the width of the support and resistance zones within the breakout area. A higher value results in larger S/R boxes.

4) Min. Number of Tests before Breakout: 2

The minimum number of attempts the price has made to break through the support or resistance level.

Arrow Settings

5) Arrow Size: 3

This parameter controls the size of the arrows for buy and sell signals. A higher value results in larger arrows.

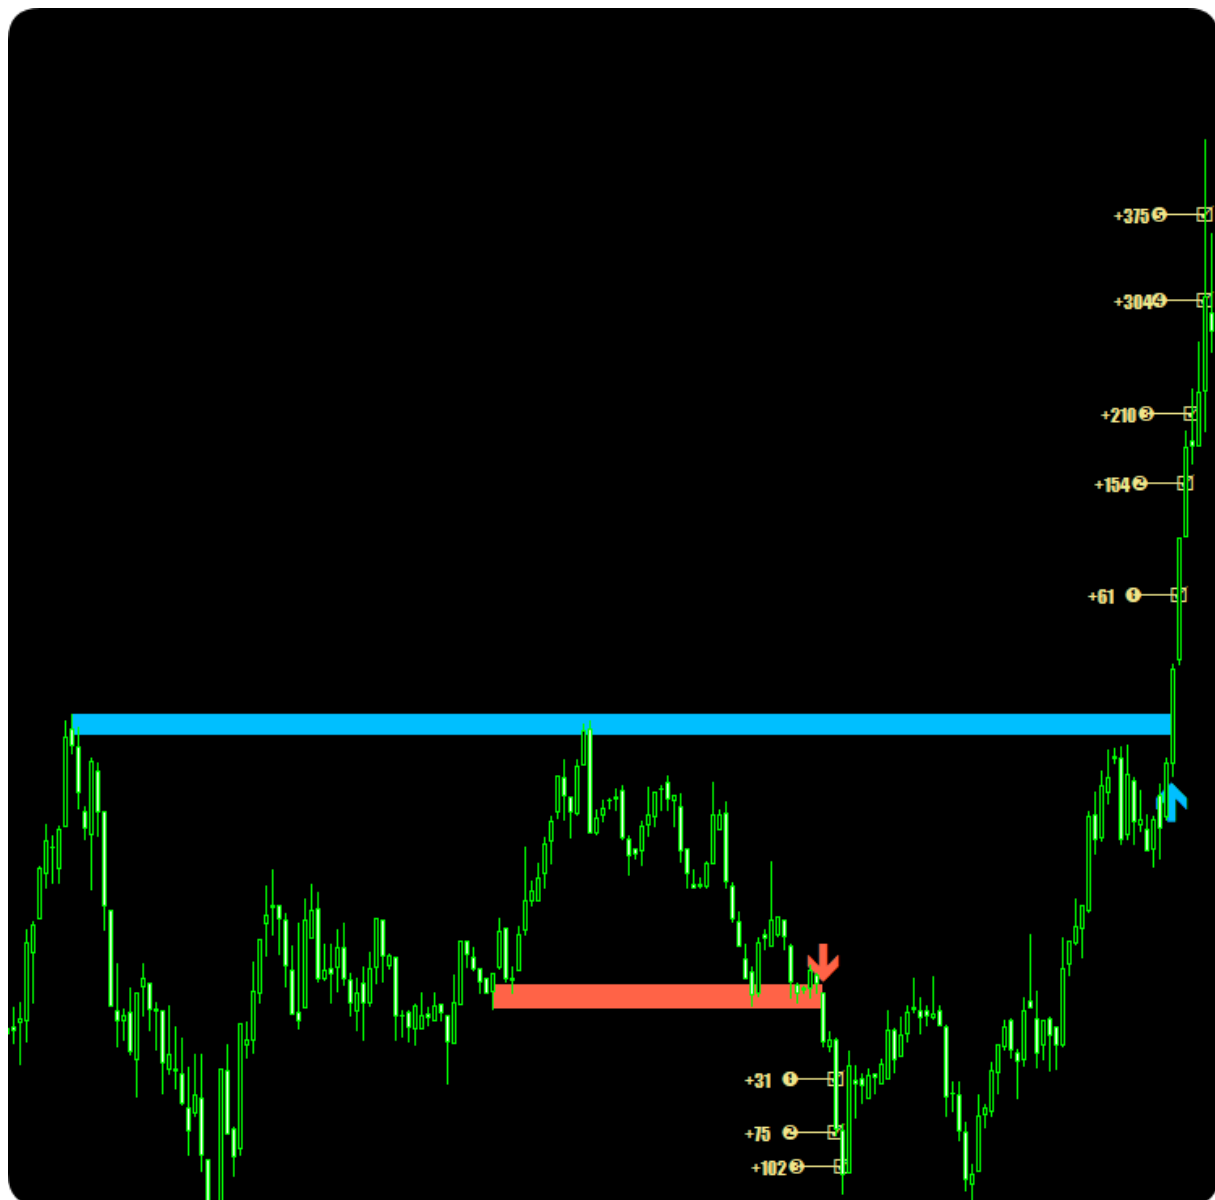

6) Up Arrow: DeepSkyBlue

That is the color of the buy arrow signal.

7) Down Arrow: Tomato

That is the color of the sell arrow signal.

Zone Settings

8) Up Zone: DeepSkyBlue

That is the color of the support zone.

9) Down Zone: Tomato

That is the color of the resistance zone.

10) Fill Background: true

This parameter allows you to fill the background with colors representing the resistance and support zones. If set to false, the zones will remain transparent.

Take Profit Settings

11) Show Fibonacci Take Profit Levels: True

This input automatically shows all 5 take profits based on Fibonacci Levels.

TP-1 Fibo Levels until TP-5

These are the default Fibonacci take-profit levels expressed as percentages. *We recommend keeping them at the default settings, as we believe they represent the optimal values.*

12) Extra Pips Added to SL: 700

By default, the indicator sets the stop loss at the support or resistance zone just below or above the breakout. You can add extra pips to the original stop loss for more trading flexibility. Setting this to 0 will use the original stop loss without any additional pips.

13) TP Color: Khaki

You can change the color of the Fibonacci take profit levels.

14) SL Color: Magenta

You can change the color of the stop loss level.

Alert Settings

15) Enable Pop-up Alerts: True

You will automatically get Breakout alerts on your MT4 terminal.

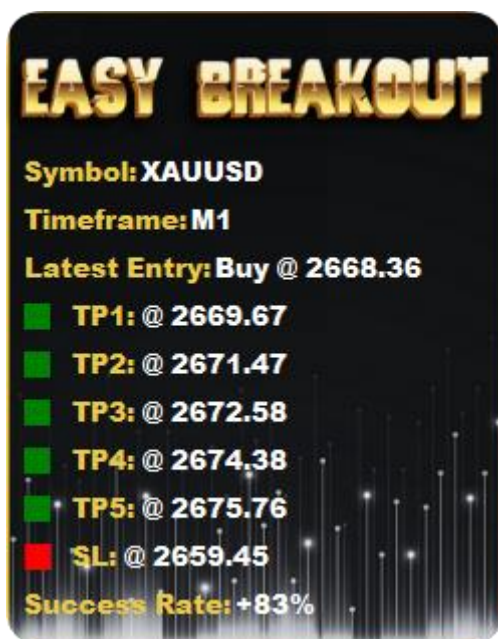

16) Enable Alerts via email: True

You will automatically get Breakout alerts to your email.

17) Enable Notifications Mobile: True

You will automatically get Breakout alerts through push notifications on your phone.

Panel Settings

18) Show Panel: True

This parameter controls the display of the Easy Breakout statistics dashboard. Setting it to false will hide the panel.

19) Panel Size: 250

This parameter adjusts the overall size of the dashboard panel. Lower values make the panel smaller, while higher values make it larger.

20) X and Y Shift

These inputs allow you to manually move the panel to any location on your MT4 chart.

21) Gap in pixels

This parameter sets the spacing between the text elements within the Easy Breakout dashboard.

22) Font name: Arial Black

This parameter sets the font inside the Easy Breakout dashboard.

23) Font size: 10

This parameter adjusts the font size of the Easy Breakout dashboard. Increase the value for larger text or decrease it for smaller text.

24) Font Color 1: Yellow

This parameter is the color of the statistics text inside the Easy Breakout Dashboard.

25) Font Color 2: White

This parameter is the color of the results text inside the Easy Breakout Dashboard.

26) Enable Win-Rate: True

This parameter is able to show or hide the success rate inside the Easy Breakout Dashboard.
